

Criterion E – Evaluation

No.	Success Criteria	Met/Not Met	Evaluation
1	Application should have the following pages: Home, Login, Sign Up, Dashboard, Tasks, Calendar, Student Information, Chat, Fees, and Files.	Met	Application consists of all the mentioned pages except the sign up page because this application is currently only for my client. However, in the near future, a sign up page will be added to allow potential clients to create accounts and use this application.
2	Client can create account or log into existing account.	Met	Client can log into existing account by entering a username and a password. Since, this application is currently only for my client, no sign up page has been made. Hence, new accounts cannot be created as of now.
3	Client can schedule classes on the calendar page.	Met	Client can schedule classes and keep records of previous classes for every student.
4	Client can create classes, add, and remove students and access student information.	Met	Client can use the Student Information page of the application to add and delete students from her record as well as to view personal information for every student.
5	Client and client's students should get an email reminder after scheduling a meeting.	Met	Client can schedule a meeting on the Calendar page. Immediately after the meeting has been schedule, an email reminder is sent to the student. Similarly, when the client uploads a task, the student receives an email reminding them about the given task and its due date. On the fee page, once the fee record has been made, the client's parent receives an email reminding them about the pending fee or informing them that the fee has been paid.
6	Client can upload files for their student to keep track of all the resources that have been used throughout the classes.	Met	Client can upload files for her students in order to keep track of the resources she has given. This can be done by using the Files page where she can view a

			record of all the files she has given for each student.
7	Client can upload assignments to keep track of any tests that were conducted. Client can also grade these assignments in order to keep track of the student's improvement.	Not Met	While the client can upload assignments/tasks, she would not be able to grade it and keep a track of the scores currently. Due to a time constraint, I was not able to code and implement this feature. However, I do plan on including this feature in the future development of this application.
8	Client can track if a student has or has not paid the fee. Client's students can pay their fee through this application. Client and student, both will be notified by mail once the payment has been made.	Not Met	While the client can create, manipulate, and delete records of fee paid by her students. The students will not be able to directly pay on this application as of now as it is an offline application.
9	Client can navigate through the application and its features through the Dashboard page.	Met	Client is able to navigate through the application and access every main component of the application through the Dashboard page. Client can visit the different pages such as Fee page, Tasks page as well as logout of the application.

Recommendations:

- I was advised by my supervisor to continue this project as a website or to connect it to the internet but as of now, the client requested for an offline platform so that she can work on it without needing Wi-Fi. However, in the near future, I plan on coding this application as a website to make it more accessible to other potential clients as well as include features such as paying directly on the application using a payment portal and directly communicating with students on the platform.
- My client advised me to modify the application later on so that records for multiple students with the same name can be created, manipulated, and deleted without causing ambiguity and logical errors in the program.
